ABSTRACT

Research in my group is focused on the synthesis and application of biofunctional materials, surfaces and nanoparticles. We are working on the development of methods for surface functionalization with an emphasis on photochemical techniques, surface micropatterning, wettability and superhydrophobicity. In this talk I will present our recent results on the development of methods for surface photo-patterning and fabrication of superhydrophobic-superhydrophilic structures. Different biological applications of produced polymer substrates, including cell patterning and cell screening will be briefly discussed.

Dr. Pavel Levkin studied at the Moscow Institute of Fine Chemical Technology and carried out his PhD (awarded in 2007) with Volker Schurig at the University of Tübingen. From 2007 – 2009, he was a postdoctoral fellow with Jean M.J. Fréchet and Frank Svec at the University of California, Berkeley, and in 2009, he became head of the Helmholtz Research Group of Biofunctional Materials at the Karlsruhe Institute of Technology and the University of Heidelberg, Germany. Levkin’s research is focused on the investigation of cell-surface interactions and the development of biofunctional materials, as well as nanoparticles for drug- and gene-delivery applications. Levkin is a recipient of the Ewald Wicke Award (2014), the ERC Starting Grant (2014) and the Heinz Maier-Leibnitz Prize (2015).
